                                                          This protein comprises isoform c' of the rat ob receptor. The obreceptor has numerous isoforms resulting from alternative splicing; a novel isoforms, designated f, g and c' are disclosed (see AAW34258-60). Isoform c' differs from the 1162-residue wild-type protein (see AAW34257) in that after Lys-889 there are only 3 amino acids. The c' isoform can be expressed in host cells, particularly E. coli, yeast or mammalian cells. It is used to identify specific binding ligands. Agonists, antagonists and ligand mimetics can be identified that are potentially useful in the study, prevention and
                     adaptation of the speci-
                       treatment of obesity.
(NB. the amino acid sequence of isoform c' was produced by adaptation of the wild-type ob receptor sequence provided in Fig 1

                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents the obesity protein receptor of the invention. The gene sequence may be used for screening of warm animals (such as rats) for spontaneous mutations resulting in to ob protein receptor gene which leads to animals having an obese phenotype. These are useful in the study of mechanisms of obesidevelopment of anti-obesity drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Key

An anti-WSX receptor antibody can be used as an agonist to activate the WSX receptor. It can also be used to decrease body weight and/or fat-depot weight and/or food intake in an obese mammal. WSX receptor ligands can be used to enhance proliferation or differentiation of lymphoid, myeloid or erythroid blood cell lineages. This is useful when a mammal, especially a human, is suffering from decreased blood cell levels, i.e. anaemia, caused by chemotherapy, radiation therapy or bone marrow transplantation therapy. It can also be used to repopulate blood cells in a mammal. The products can also be used to treat, e.g. neoplastic disorders, carteriosclerosis, Type II diabetes, polycystic ovarian disease, cardiovascular diseases, osteoarthritis, dermatological disorders, hypertriglyceridaemia, cancer and cholelithiasis.

Its amino acid sequence was deduced from a cDNA clone (AAT69590) isolated from a choroid plexus cDNA expression library, and differs from long form ObR (AAW19115) in having a shorter cytoplasmic domain. Unlike long form ObR, the short form does not transduce signal mediated by the STAT pathway. The db mutant in db/db obese mice expresses an aberrantly spliced transcript that encodes a truncated ObR protein that is identical to short form ObR. ObR proteins, peptides, antibodies, agonists and antagonists can be used in the diagnosis and treatment of body weight disorders such as obesity, cachexia and anorexia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI; 199

                        The patent discloses obese receptor (ObR) proteins and nucleic acids encoding them. ObR protein participates in the regulation of mammalian body weight. The invention also relates to a method of identifying therapeutic compounds for the treatment of a body weight disorder. The method involves contacting a cell that expresses a mammalian ObR protein, a JAK2 protein and a mammalian SOCS-1 protein with a test compound. The method is useful for identifying compounds which modulate ObR gene expression and gene product activity, which can be used as agents to control body weight particularly as therapeutic agents for treating body weight disorders, including obesity, cachexia and anorexia. The present sequence is short form ObR protein from murine.
                                                                                                                                                                                                                                            Identifying compounds for treating anorexia or cachexia, comprises correceptor protein, JAK2 protein and

                                                                                                                                                                                                                                          This protein comprises isoform f of the rat ob receptor. The obreceptor has numerous isoforms resulting from alternative splicing; a novel isoforms, designated f, g and c' are disclosed (see AAW34258-60). Isoform f differs from the 1162-residue wild-type protein (see AAW34257) in that after Lys-889 there are only 6 amino acids. In the cDNA (see AAT93104), these codons are then followed k a stop codon. The f isoform can be expressed in host cells, particularly E. coli, yeast or mammalian cells. It is used to identify specific binding ligands. Agonists, antagonists and ligand mimetics can be identified that are potentially useful in the study, prevention and treatment of obesity.

(NB. the amino acid sequence of isoform f was produced by adapted to the study of the wild-type of the recent of obesity.

The OB-R can be used to treat obesity, optionally in ....

CC

The OB-R can be used to treat obesity, optionally in which cholesters.

CC

The OB-R can be used to treat obesity, optionally in which cholesters.

CC

CC

The OB-R can be used for reducing body weight. It may also be used in agriculture to produce leaner food animals, e.g. beef cattle, or swine poultry, sheep. An antibody specific for OB-R can be used to molecule encoding OB-R in a sample, optionally in vivo, while the nucleic acid molecule associated with obese phenotypes, or diagnostically to measure its encoded RNA and protein in nutritional disorders. The nucleic acid molecule can be used in gene therapy, or the antisense nucleic acid molecule can be used to antagonise leptin activity. The can be used to antagonise leptin activity. The can be used to antagonise leptin activity. The can be used to antagonise leptin activity. The can be used to antagonise leptin activity. The can be used to antagonise leptin activity. The can be used to antagonise leptin activity. The can be used to antagonise leptin activity. The can be used to antagonise leptin activity. The can be used to antagonise leptin activity. The can be used to antagonise leptin activity. The can be used to antagonise leptin activity. The can be used to antagonise leptin activity. The can be used to antagonise leptin activity. The can be used to antagonise leptin activity. The can be used to antagonise leptin activity.
Leptin receptor, OB-R, polypeptide optionally in conjunction with treapressure and high cholesterol

                                                                                                                                                                                                                                                                                                                                           receptor has numerous isoforms resulting from alternative splicing;

C 3 novel isoforms, designated f, g and c' are disclosed (see

C AAW34258-60). Isoform g is much shorter than the 1162-residue

C wild-type sequence (see AAW34257). 18 N-terminal amino acids are

C spliced to a large fragment of the wild-type molecule, beginning at

C Pro-166. The isoform then extends for the remainder of wild-type

C ob receptor molecule. Alternatively, it could contain another

C isoform variation, such as isoform a, b, c, d, e or f. The g

C isoform can be expressed in host cells, particularly E. coli, yeast

C or mammalian cells. It is used to identify specific binding

C identified that are potentially useful in the study, prevention and

C treatment of obesity.

C (NB. the amino acid sequence of isoform g was produced by

adaptation of the wild-type ob receptor sequence provided in Fig 1
                                                                                                                                                                                                                                                                            Query Match

The ob receptor has numerous isoforms resulting from alternative splicing; 3 novel isoforms, designated f, g and c' are disclosed (see AAW34258-60). These isoforms also apply to mouse and human ob receptors. The isoforms can be expressed in host cells,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isoform(s) of the Obspecific binding ligands, and treatment of obesity

Its amino acid sequence was deduced from a cDNA sequence (see AAT64961) obtained by PCR amplifications. The sequence differs at only 1 position from the OB-R sequence from rats with a fatty (fa) mutation; the fa OB-R mutant receptor has proline at amino acid 269 rather than glutamine (see AAW23399). This is a result of an A to C transversion in the fa OB-R gene (see AAT64962). Every tissue examined in an fa/fa Zucker rat was homozygous for this mutation. The wild-type and mutant OB-R can be expressed in prokaryotic or eukaryotic host cells. They are useful in assays to identify putative ligands, which may be receptor agonists or antagonists or bind with little effect, and which may be useful in understanding obesity and for its prevention and treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                25-APR-1996;

It is a member of the class I cytokine receptor family and is predominantly expressed in the hypothalamus. Its amino acid sequence was deduced from a hypothalamus cDNA clone (AAT69591). A short form (AAW19114) of murine ObR, expressed in the choroid plexus, is associated with the obese phenotype in db/db mice. The 2 forms differ in the length of the cytoplasmic domain. ObR proteins, peptides, antibodies, agonists and antagonists can be used in the diagnosis and treatment of body weight disorders such as obesity, cachexia and anorexia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention provides a method for identifying modulators of binding of a phosphorylated leptin receptor with tyrosine phosphatase ID PTP-ID). The method comprises: (a) contacting a tyrosine-985 phosphorylated leptin receptor or its phosphorylated fragment with protein PTP-ID or its fragment in the presence and absence of a candidate agent under conditions in which in the absence of the agent the binding of the phosphorylated leptin receptor or fragment with PTP-ID or its fragment can be detected; and (b) detecting the binding of the phosphorylated leptin receptor and PTP ID; where an increase in binding detected in the presence of the agent, indicates that the agent enhances binding, and a decrease in binding in the presence of the agent indicates that the agent receptor-dependent PTP-ID phosphorylation are useful as drugs in weight content of animals, particularly in mammals. Disorders that can be treated by PTP-ID modulators include obesity and its associated diseases, e.g. hypertension, heart disease and type II diabetes, and weight loss associated with cancer and AIDS. Additionally the agents identified may condulated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The patent discloses obese encoding them. ObR protein participates body weight. The invention also relates therapeutic compounds for the treatment The method involves contacting a cell t protein, a JAK2 protein and a mammalian compound. The method is useful for iden ObR gene expression and gene product ac agents to control body weight particulate treating body weight disorders, including the protein sequence is murine long form.

An anti-WSX receptor antibody can be used as an agonist to activate the WSX receptor, leading to enhanced proliferation or differentiation of a cell expressing the WSX receptor. It can also be used to decrease body weight and/or fat-depot weight and/or food intake in an obese mammal. WSX receptor ligands can be used to enhance proliferation or differentiation of lymphoid, myeloid or expecially a human, is suffering from decreased blood cell levels, i.e. anaemia, caused by chemotherapy, radiation therapy or bone marrow transplantation therapy. It can also be used to repopulate blood cells in a mammal. The products can also be used to treat, e.g. neoplastic disorders, arteriosclerosis, Type II diabetes, polycystic ovarian disease, cardiovascular diseases, insulin creasistance, hypercholesterolaemia, hypertriglyceridaemia, cancer

```
CC The invention relates to a novel agonist or antagonist of a haemopoletic CC growth factor which is capable of binding a region of the CRD3 (cytokine ceceptor domain 3) of the human GM-CSF receptor/IL-3R/IL-5R shared CC subunit h-beta-c, or an equivalent CRD in a different haemopoletic CC growth factor receptor or other cytokine receptor. Binding of the CC agonist or antagonist has an effect on the interaction between CDR3 and CC CDR4 (or analogous domains) which mediates the agonist or antagonist property. In particular, the agonist or antagonist  The agonists are used for treating conditions currently cor antagonist. The agonists are used for treating conditions currently corrected by GM-CSF (granulocyte macrophage-colony stimulating factor), CC IL-3 (interleukin-3), IL-5, and other members of the family of the aemopoletic growth factors. Haemopoletic growth factor antagonists are cureful for treating diseases such as myeloid and lymphocyte leukaemias, conditions (e.g., asthma, rheumatoid arthritis and atherosclerosis). CC cytokine receptor subunits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New agonists or antagonists of haemopoletic growth factors for treating myeloid and lymphocyte leukemias, tumors and acute and chronic inflammation such as asthma, rheumatoid arthritis and atherosclerosis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Fig
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       <u>..</u>

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 surface receptor, where the oligopeptide enhances the effect of ligand binding to the receptor expressed by a cell. The oligopeptide and cell can be used to screen for bioactive agents capable of modulating the internalisation of a cell surface receptor. Internalisation sequences of the extracellular domains of receptor inhibit internalisation of the receptor, but do not affect binding of the ligand. Inhibition of receptor internalisation results in more receptors at the cell surface to bind the ligand, i.e. an increase in ligand binding effectiveness. The increase in ligand signalling is useful for treating diseases where hormone sensitivity is reduced, e.g. non-insulin dependent diabetes
This sequence represents a peptide derived from the extracellular activation sequence of the human leptin receptor.

Activation sequences are involved in modulation of receptor
                                                                                                                      Claim 8;
                                                                                                                                                                                                          Modulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present leptin internalisation sequence receptor fragment, was used in the preparation of a novel oligopeptide. The oligopeptide comprises an internalisation domain of 8-40 amino acids having a sequence corresponding to the extracellular domain of a cell
                                                                                                                                                                                                                                                                                                                                                                                      (RECE-) RECEPTRON INC

cc responses and are separate from the ligand binding site. Activation cc sequences are important in two distinct ways: in the modulation of cc receptor internalisation; and/or in the modulation of activation of the receptor. Use of peptides corresponding to the activation sequence of a creceptor can retard or inhibit receptor internalisation, thereby cc increasing or stabilising the steady-state number of active receptors on the cell surface. This has the effect of increasing signalling per unit cc for ligand. In addition, the receptor is classed as a type 2 cell surface receptor, meaning that such peptides can actually replace the requirement cc for the ligand, causing ligand-independent activation. This activation is consequent activation that occurs when two receptors bind one peptide subsequent activation that occurs when two receptors bind one ligand. This peptide could be used to treat disorders involving an inadequate or inappropriate response from its corresponding receptor e.g., obesity.
